Arka plan: Diğer alanlarla karşılaştırıldığında 112 acil sağlık personeli yoğun çalışma koşulları ve travmatik olaylarla karşılaşmakta, çalışma ortamı olarak yıpratıcı bir ortamda çalışmaktadırlar. Öngörülemeyen çalışma koşulları hastane öncesi acil sağlık personelinde kaygı ve gerginliğe sebep olmaktadır (Adriaenssens vd., 2013; Akpınar ve Taş, 2011).

ISBN: 978-9952-8536-7-4 DOI: https://doi.org/10.30546/19023.978-9952-8536-7-4.2024.501

Yüksek düzeyde kaygı bireyin çalışırken hata yapmasına, çalışma arkadaşları arasındaki ilişkinin bozulmasına ve verimliliğinde azalmaya neden olur (Postacı vd., 2020). İş verimliğinin azalması kişisel tatminin azalmasına, mesleki başarının olumsuz etkilenmesine ve mesleki doyumun da azalmasına sebep olduğu düşünülmektedir.

Amaç: Bu çalışma Türkiye genelinde 112 acil sağlık hizmetlerinde çalışan personelin mesleki kaygı düzeylerinin mesleki doyumuna olan etkisini inceleyerek, demografik özellikler bakımından mesleki kaygı ve mesleki doyumu karşılaştırmayı amaçlamıştır.

Metot: Bu araştırma kesitsel türde bir araştırmadır. Araştırmanın evrenini Türkiye'de görev yapan hastane öncesi acil sağlık hizmeti sunan 34.000 sağlık personeli oluşturmaktadır (Anonim 2022). Araştırmada uygulama yapılacak acil sağlık personeli sayısı belirlenirken 34.000 bireye sahip evreni temsil edecek doygunluğa ulaşacak örneklem hesabı yapılmıştır. Araştırma kapsamında Türkiye'nin farklı illerinde görevli 401 paramedik ve acil tıp teknisyenine ulaşılmıştır. Araştırmada uygun örneklem yöntemi ile veri toplanmıştır. Veri toplama aracı olarak "Mesleki Doyum Ölçeği", "Acil Sağlık Hizmeti Sunan Personelin Mesleki Kaygı Ölçeği" ve "Kişisel Bilgi Formu" kullanılmıştır. Kişisel bilgi formu cinsiyet, yaş, medeni durum, çocuğu olması, eğitim durumu, branşı, mesleki deneyim yılı, mesleği seçme durumu, bir nöbette ortalama vaka sayısı, mesleki deneyimde mobing ve şiddete maruz kalma durumu, görev yaptığı istasyonun konumu değişkenleri bulunmaktadır. Veri analizinde toplanan veriler Jamovi 2.4.11 Programı ile analiz edilmiştir.

Bulgular: Yapılan analiz sonucunda cinsiyet, yaş, medeni durum, çocuğunun olması, branş, mesleki deneyim yılına göre mesleki kaygı düzeyinde anlamlı farklılık yoktur, cinsiyet ve eğitim durumuna göre

ISBN: 978-9952-8536-7-4 DOI: https://doi.org/10.30546/19023.978-9952-8536-7-4.2024.501

mesleki doyum düzeyinde anlamlı farklılık yoktur fakat mesleği seçme durumu, bir nöbette ortalama vaka sayısı, mesleki deneyimde şiddet ve mobinge maruz kalma, görev yaptığı istasyonun konum özelliklerine göre mesleki doyum ve mesleki kaygı düzeyinde anlamlı farklılık vardır.

Sonuç: Mesleği isteksiz seçenlerin mesleki kaygısı istekli seçenlere göre, mesleki deneyiminde mobing ve şiddete maruz kalanların mesleki kaygısı kalmayanlara göre daha yüksek olduğu ve bir nöbette ortalama vaka sayısı arttıkça mesleki kaygı düzeyi arttığı görülmüştür. Mesleki doyum düzeyi; mesleği istekli seçenlerin, mesleki deneyimde mobing ve şiddete maruz kalmayanların ve bir nöbette ortalama vaka sayısının az olduğu bireylerde daha yüksek olduğu görülmüştür. Yapılan Spearman Korelasyon analizi sonucunda mesleki kaygı ve mesleki doyum arasında negatif yönlü korelasyon olduğu saptanmıştır.

Anahtar kelimeler: Acil sağlık hizmetleri, mesleki doyum, mesleki kaygı

Background: Compared to other fields, 112 emergency healthcare personnel face intense working conditions and traumatic events, and they work in an abrasive working environment. Unpredictable working conditions cause anxiety and tension in prehospital emergency health personnel (Adriaenssens et al., 2013; Akpınar & Taş, 2011).

ISBN: 978-9952-8536-7-4 DOI: https://doi.org/10.30546/19023.978-9952-8536-7-4.2024.501

High levels of anxiety cause the individual to make mistakes while working, the relationship between coworkers deteriorates and productivity decreases (Postacı et al., 2020). It is thought that the decrease in work efficiency leads to a decrease in personal satisfaction, a negative impact on professional success and a decrease in professional satisfaction.

Objective: This study aimed to compare occupational anxiety and occupational satisfaction in terms of demographic characteristics by examining the effect of occupational anxiety levels on occupational satisfaction of personnel working in 112 emergency health services throughout Turkey.

Method: This study is a cross-sectional study. The population of the study consists of 34,000 health personnel providing pre-hospital emergency health services in Turkey (Anonymous 2022). While determining the number of emergency health personnel to be applied in the study, a sample that will reach the saturation to represent the universe of 34,000 individuals was calculated. Within the scope of the research, 401 paramedics and emergency medical technicians working in different provinces of Turkey were reached. In the research, data were collected with the appropriate sampling method. "Occupational Satisfaction Scale", 'Occupational Anxiety Scale of Emergency Medical Service Providers' and 'Personal Information Form' were used as data collection tools. The personal information form includes variables such as gender, age, marital status, having children, educational status, branch, years of professional experience, status of choosing the profession, average number of cases in a shift, exposure to mobbing and violence in professional experience, and the location of the station. The data collected in the data analysis were analyzed with Jamovi 2.4.11 Program.

ISBN: 978-9952-8536-7-4 DOI: https://doi.org/10.30546/19023.978-9952-8536-7-4.2024.501

Findings: As a result of the analysis, there is no significant difference in the level of occupational anxiety according to gender, age, marital status, having children, branch, years of professional experience, there is no significant difference in the level of occupational satisfaction according to gender and educational status, but there is a significant difference in the level of occupational satisfaction and occupational anxiety according to the status of choosing the profession, the average number of cases in a shift, exposure to violence and mobbing in professional experience, and the location of the station.

Conclusion: It was observed that the level of occupational anxiety of those who chose the profession reluctantly was higher than those who chose the profession willingly, those who were exposed to mobbing and violence in their professional experience were higher than those who were not exposed to mobbing and violence in their professional experience, and the level of occupational anxiety increased as the average number of cases per shift increased. The level of occupational satisfaction was found to be higher in individuals who chose the profession willingly, those who were not exposed to mobbing and violence in their professional experience, and those who had fewer average cases in a shift. As a result of Spearman Correlation analysis, it was determined that there was a negative correlation between occupational anxiety and occupational satisfaction.

Key words: Emergency health services, occupational satisfaction, occupational anxiety
